NUTRASHIELD PRO - BACKED BY SCIENCE PROVEN WITH PERFORMANCE!

Formulated with 100,000 CFU/ g forage of *Pediococcus pentosaceus* R1044 plus a tailored enzyme formulation, NutraShield Pro has the power to provide:

- Fast and efficient fermentation
- Reduced DM & nutrient losses
- Lower chances of bad fermentations, including clostridia

WHEN TO USE NUTRASHIELD PRO

Designed for any alfalfa, grass and corn silage crops up to 50% dry matter. The right solution for small grain silages up to 40% dry matter. A great option for crops that are intended to be fed after 15 days of ensiling. Pro is also designed to be used on crops that are wetter than anticipated and will help produce a proper fermentation when these less than ideal conditions are present.

FAST PH DROP FOR OPTIMUM QUALITY

The faster fermentation achieved by the combination of *P. pentosaceus* and enzymes is validated by the graphs on the reverse side from trials on haylage: faster pH drop means greater DM and nutrient retention. Our advanced product formulation helps to scavenge oxygen to help complete the preservative ensiling pH drop with optimum efficiency inside 15 days.
